

«AAC» is the first company in Azerbaijan producing cellular aerocrete blocks at a high technology and on the original equipment of German company "Wehrhahn". The aerocrete products are manufactured more than 50 countries around the world, where more than 200 plants are operating. We are proud that the same plant has been built in Azerbaijan!

The production capacity of the factory is 600 cubic meters of aerocrete and 100 tones of lime per day. Aerocrete in comparison with other construction materials differs by durability, longevity, heat and cold resistances, ecological, fabrication and other qualities. Aerocrete can be easily treated by using conventional hand or electric instrument. At the moment the products of aerocrete are used in internal and external walls, dividing walls, ceilings and even in construction of stairs. The appearance of the aerocrete in the Azerbaijan market will fundamentally change the technology and timing of construction works.

As the first plant in the Caucasus for the production of concrete blocks, we are constantly developing new methods and technologies, and strive to expand the scope of our activities.

We always strive to take into consideration the interests and abilities of our clients and provide them with the necessary information. Customer's confidence is a major issue for us because it is an important factor for successful sales.
